Blinkit Bug Report

BUG 1 – Invalid Phone Number Accepted at OTP Verification

Steps

1. Open the Blinkit app/website.
2. Enter an invalid/placeholder phone number (e.g., a sequential number like 1234567895) in the login field.
3. Submit the number.
4. Observe the OTP Verification screen.

Expected Result

The system should validate the phone number format and reject obviously invalid or placeholder numbers before proceeding to OTP verification.

Actual Result

The app accepts the sequential placeholder number without any validation and proceeds directly to the OTP Verification screen, sending a verification code to an unverified/invalid number.

Impact

Weak input validation on the login flow could allow fake or improperly formatted numbers to pass through, potentially leading to failed deliveries or misuse of the OTP system.

BUG 2 – Search Returns Mismatched Results for Garbage Input

Steps

1. Open the Blinkit app/website.
2. Locate the search bar.
3. Enter a random, meaningless string (e.g., "kuhgukdsnf").
4. Observe the search results displayed.

Expected Result

The search should either display "No results found" or return results genuinely relevant to the entered text.

Actual Result

The search silently "corrects" the input to an unrelated phrase (shown as 'Showing results for "kuggukds mf"') and returns a full page of unrelated product results (various Kulcha/bread items) instead of indicating no match was found.

Impact

Misleading search behavior can confuse users into thinking their search term matched real products, reducing trust in the search feature and search accuracy.

BUG 3 – Payment Method Icons Not Clickable on QR Payment Screen

Steps

1. Proceed to checkout and reach the "Select Payment Method" QR screen.
2. Attempt to tap/click on the Google Pay, PhonePe, or Paytm icons displayed at the top.
3. Observe the response (or lack of it).

Expected Result

Tapping an icon should either select that payment method and launch its respective payment flow, or clearly indicate the method has been selected.

Actual Result

The icons are displayed as static, non-interactive images. No click response, no highlight, and no alternate flow is triggered — the only functional way to pay is by scanning the QR code.

Impact

Users who prefer app-based payment (instead of scanning a QR code) have no way to proceed, which blocks or frustrates a portion of users during checkout — especially problematic on a mobile device where scanning one's own screen isn't practical.

Select Payment Method

BUG 4 – Active Delivery Location Not Reflected in Saved Address Selector

Steps

1. Note the delivery location shown on the home screen header (e.g., "9XHV+6PH, Om Nagar Colony...").
2. Tap the delivery address bar to open the "Select delivery address" panel.
3. Compare the location shown on the home screen with the addresses listed in the panel.

Expected Result

The currently active/detected delivery location should be visible in the address panel, either highlighted as selected or listed as the current location option.

Actual Result

The address panel only shows two previously saved "Home" addresses, neither of which matches the location currently displayed on the home screen. There is no way to confirm which address is actually driving the delivery estimate.

Impact

Users cannot verify which address their order will actually be delivered to, creating a risk of orders being delivered to the wrong location.

BUG 5 – Cart Items Not Maintained in Order of Addition

Steps

1. Add an item (Item A) to the cart.
2. Add a second, different item (Item B) to the cart.
3. Open the "My Cart" page and observe the order in which items are listed.

Expected Result

Items should appear in a consistent and predictable order — typically the order in which they were added (Item A first, then Item B).

Actual Result

The item added first shifts position when a new item is added, instead of remaining in its expected place, making the displayed order inconsistent with the actual sequence of addition.

Impact

Users cannot rely on the cart to reflect their actual shopping sequence, which can cause confusion when reviewing or verifying items before checkout.
